Quote:
The Nobel Prize winner, Dr. Otto H. Warburg, had devoted his life to the cancer.

Dr. Warburg was one of the 20th centuries leading biologists, and he dis of cancer is too much acidity in the body, meaning that the pH in the bod of 7.365, which constitutes an "acidic" state. Warburg investigated the m the respiration of cells and discovered that cancer cells maintain and thr 6.0, due to lactic acid production and elevated CO2. He firmly believed t relationship between pH and oxygen. Higher pH, which is Alkaline, means oxygen molecules, while lower pH, which is acidic, means lower concentr oxygen that is needed to maintain healthy cells.

In 1931 Dr. Warburg was awarded the Nobel Prize in Medicine for this im stated, "Cancerous tissues are acidic, whereas healthy tissues are alkali OH- ions, if there is and excess of H+, it is acidic; if there is an excess alkaline".

In his work The Metabolism of Tumours Warburg demonstrated that "all fo characterized by two basic conditions: acidosis and hypoxia (lack of oxyg acidosis are two sides of the same coin: where you have one, you have t have an absolute requirement for oxygen, but cancer cells can live witho exception. Deprive a cell 35% of its oxygen for 48 hours and it may beco

Dr. Warburg has made it clear that the root cause of cancer is oxygen de acidic state in the human body. Dr. Warburg also discovered that cancer breathe oxygen) and cannot survive in the presence of high levels of oxy state.
