what you are looking at is called a self sufficient system.

We are part of it. We human beings, in this material universe are just part of the system... we are not something separated from it. As we see that everything is better understood by the law "matter is not created neither destroyed, it only changes form" exactly what happens...You perceive that matter is "recycled", the 1st law of thermodynamics that it gets transformed....same trend of thought. However, the basic point is that it was created. It has always existed. Your assumption that there is a need from something to create exactly what I wrote about in the beginning of the thread " the meaning of time in a linear vision of time is wrong. Because you run into the problem of finding an origin or infinitum...without finding a "origin" or beginning you cannot assume that something happened in the beginning. However, when you look at time as a circle, a continuous loop, that the 3 aspects of time are always there and that there is always a cause and effect, time is eternal, cyclical and repetitive and because of all of this, it is always there.

Logically, reasonably speaking the universe couldn't be created. It has always been there are opinions that may disagree with this statement, however; what is the point, of course, besides the fact that some book said so...
