This is on continued research from when I found someone had made a ca
html in JavaScript file so making it store as a cache before and after loading.
A JavaScript file can be loaded dynamically and stores it's self for some reas
experimentation of our theme in parts.....
Yet someone mentioned they didn't believe it was a good principle and I
parts of the idea in terms of the more markers and files to include the lo
it takes, which is why I started this.
So how to go about changing everything for this:

1) When making addition in the standard html theme of JS calling items i
inputs and then JavaScript as meant for.
2) On concurrent reload JavaScript engines in the browser html longer then
3) the file included is not included by the Smarty system making Smarty store
the item longer

So on this I decided on creating a JavaScript Template and made it load our whole
theme, not parts and tested the speed of inclusion through Smarty's debu
faster than HtmlTpl to begin.
So making all the addition of a faster loading JavaScript template file which over
head for end users and quicker loading times of inputting any data throu

The file where this is configured is in theme.php and needs the extension ch
present I didn't also change the type of data it will find as it is still text
just now read JavaScript file for the theme.
