fixed it, since the core has also [To do by hacker](#) and added a few bit to add and add tpl back again to the Xoopslists as should be....xhtml, html require h and works with smarty as a template you know
) so why TPL as we are using as they are templates [W3C](#) and so no headers n

so now all done....the Wiki tho to fix it takes the edit portion being through maybe requires a blank htm system dummy, which are all now tpl instead

since the wiki is now ok [SVN](#) copy as a sub as slow down a littel and check one love people [CMS](#) free

well weird when you check how the code is progressing already stripped may do third and final..

. big warning even [PHP](#) is meant to be string! !!! ! really...it doesn't-and-will-not-except-spacing!!!!
it really slows things down [PHP](#) it's slow, yet peoples use of it

Please pay attention and tell others and as soon as can will inform Smart speed over last few weeks of learn where [PHP](#) as a substitution and adding it all together to o finalize am actualize our copy of Xoops for all

Anyways as you can see my writting is very compacted at [SVN](#) the moment and while me brain is at 1000 miles an hour peace people....
