In both JavaScript and PHP we have lots of Functions for making things work, woul
add these when and how we needed for the task involved?
So my question is does anyone know how to code a PHP Function Caller, that works on collec
the name of the Function from the filename and the data of that Function
Then the same in JavaScript to collect Functions from filenames also...

This would mean you could have folders for those Function files and thro
add any virtual task with allot less hacking for most web-development gl
