It is true everything is a matter of perspective - Where if two people stand and observe a rainbow, one might see it, and the other might not.

We are within more than a 3D world; we exist in multiple dimensions, including 8D; yet we can't see them perspectives, as each perspective we're within.

Within a 3D environment, we can observe each perspective of that item from a different angle, but it isn't infinite - as there is a limited number of perspectives on any object.

If we then question over time (4D), that we could observe that object in a different perspective, the object will remain the same, yet the perspective will slightly change; when we consider the amount of possibilities.

It is only when we go outside of dimensions where things exist as objects, like music that creates reality, that there is then the potential for infinite perspectives.
