Thanks Gibaphp that is very much appreciated for breakfast....

Ok on Searches we used no index's it finds the Id, linked with title and n item and then looks for it in the tables, it is then viewing if anything has primary index.....

After trying a text index to store data for all text....this made it much slow just a group of numbers (id's), it indexes every letter it appears...as how word is so instead searches the lot?

Basically will let you have a look at ours, on 2.2.5rc2 and we have optimized the primary, and no other index's....

My thinking then is the moment it finds the primary it finds all needed data looking time and Xoops overload....as all information should be at hand, other index's; that are not used....

P.s this isn't Xoops alone, yet all CMS systems we have looked at....we moved forward after realizing how much dirty rubbish index's had been made in point to them, other then maybe an id....Which as such is indexed in a word number MySql works sequentially so when it finds a number, it sticks this index as such....
