Though I have written ~~Xoops~~ up on

Here is a Quick look at something I just learned is possible in all web de

Basically I found something someone had done, where they placed the HTML
same code, yet called it a cache file

....

So Later on trying this same, I found it did indeed improve loading times
cache....

Yet on later Experiments realized it also does more then just cache espe
many of AJAX...which in many cases is PHP, Java and Html.....

Decided to do a bit more playing.....So now you find the page loading tim
some cases to begin.....

Yet after the original loading, it is cached in your pc, instead of loading
page; now it is loaded once and stored by the PC for later use.....

Now like I say I am discussing this with Xoops, yet it can be used in any
waiting ages for complicated tables and layout structure.....You can ins
the same bit of HTML code....just in having it load as .JS it vastly increa
Cache as such....

Now in the Xoops case we have used Smarty to the include these files....
called Smarty has it already to be filled, it then finds what it is filling fa
the items in question the same as if it was being done by AJAX....

Since including the For each in the Xoops blocks layout now in a .JS it n
the theme overall...so reducing sluggishness that is seen by many sites.
