So instead of having a single function.php file with lots of functions, you have a module that collects all functions from little files, by using their filenames as the key and the data being in the file.

So then say you wanted a Photo web site and needed extra functions to process photos. You have a module for the pages, yet then by placing the extra functions in a separate file, you add those into your functions overall.

Imagine if you were the PC and each time you needed something you read through a long piece of paper to find one line, now imagine if that was a book with an index..

On writing that's made me question how we get a permanent index of the functions from the filenames, so then it doesn't cost extra resources at rendering time to look up the exist, before performing the task...

So we need it having a list of functions and going only to the functions c
