Please, Please, Please!!!

PHP is something that is being processed....If something is processed through this technology, the processor is making millions of calculations of "on and off". So what do blank spaces do in code? 10101000000000000000010110

The processor has to calculate on and off binary for them spaces also, so

- 1) You can't read the code as well; as it takes so long to scroll down the page looking.
- 2) Your overall system runs slower as instead of reading code, really its sifting through all the unnecessary spacing..(You may think to use some script to remove those spaces in real-time = even more processing power, that is the point of the code.)
- 3).....There are loads more reasons, to be continued....
